Are you sure you don't have a hearing problem?

EXPECTED BENEFITS FROM SELF-SERVICE HEARING TEST

There are many successful projects within the scope of E-Health in Developed Countries. In the light of developing information technologies, the topics of health informatics are increasing, which puts health informatics in a position where its field of interest and application areas are constantly expanding.

Our project, Self-Service Hearing Test, will take its place as an important social responsibility project and raise awareness in the provision of audiological (ENT) findings of our country's people in the field of hearing health and in the formal education of individuals in the field of hearing health.

The biggest benefit of our project is that it can reach people in all kinds of social environments and protect the hearing health of people with hearing loss with the chance of early diagnosis with the hearing screening function.

Self-service Hearing Test reduces many costs and expenses that may occur in the future in terms of raising people's awareness about their hearing health and increasing their chances of early diagnosis.

In our opinion, Self-Service hearing test, which we view as a more social project outside the public health system with the vision of contemporary hearing services within the scope of information and communication technologies application, will be beneficial to our society.

APPLICABILITY OF OUR PROJECT

Many people in our country start looking for a solution after five years or so after developing hearing loss.

By making hearing testing accessible, our project will fulfill an important function in raising awareness of our people about their hearing health.

If individuals who do their own hearing test see that their hearing is a problem, they can prevent problems they may encounter in the future and achieve better hearing health.

Our project offers an early diagnosis solution for hearing health in people's social circles with its interactive hearing test design in the field of health screening and especially in the hearing health sector.

- We believe that hearing loss is an important issue in our country, and steps should be taken to help detect these problems in their early stages with the "Self Service Hearing Tester"®.

- Brief introduction of our invention:

"Self Service Hearing Tester"® If you think you have hearing loss, you can get an idea by doing this test.

- "Self Service Hearing Test Device"® will emphasize the "Brand" awareness and prevalence of hearing aid companies as well as the importance the Brand attaches to hearing health.

"Self Service Hearing Tester"® will help companies reach the target audience in all kinds of promotional campaigns, advertisements and other activities.

"Self Service Hearing Test Device"® is a Corporate Social Responsibility Project.

"Self Service Hearing Tester"® for ENT physicians to assist in detecting hearing loss in patients.

The "Self Service Hearing Tester"® is a simple, 40-second screening device that gives an objective measure of detecting hearing problems even in the early stages of hearing loss. Early intervention allows hearing loss to be checked and evaluated to prevent unnecessary problems in the future, and eventually provide them with a better quality of life.

DOĞUŞ MEDİKAL, SELF SERVICE HEARING AID AND PRODUCTION PROJECT AND SELF SERVICE HEARING TEST KIOKS DESIGN

This easy home screening will help you check for hearing problems. It also aims to give you an idea of what some parts of a hearing assessment might be like.

Of course, any online hearing test cannot replace a hearing screening by a hearing specialist such as an audiologist, hearing aid specialist, or ENT doctor. (Please note that due to the quiet environment of your home or office, your results may not reflect your actual hearing difficulties.)

At the end of the hearing test, you will see your results and next steps.
